Watershed Description:

The Beaver River watershed encompasses approximately 320,000 acres with about 306,000 acres in Beaver County and 14,000 acres in Iron County. The watershed is encircled by the Tushar Mountains to the northeast and east, Circleville Mountains to the southeast, and the Mineral Mountains to the west.

The estimated watershed population is approximately 3,500 people and is expected to experience a 2.6 percent population growth by the year 2020. There are about 170 farms in the watershed with an average area of 495 acres. Beaver City, the county seat, is the most populated town in the watershed with an estimated population of 3,000. Other communities in the watershed include Greenville, Adamsville, and Manderfield.

Several nonpoint source water quality problems have been identified in the watershed. They include sedimentation, phosphorus and nitrogen loading, and eroding stream banks. These pollutants are causing a decrease in water quality in the Beaver River, its tributaries, and the Minersville Reservoir.
Project Description:

Water quality improvement projects focusing on the Beaver River began in 1993 with the acquisition of an EPA 319 Grant. Since work began in 1993, 319 funds have helped over 23 landowners in the watershed improve water quality on their operations and have also helped leverage an additional $6.4 million dollars from other state and federal conservation programs for water quality improvement projects. In 2001, the watershed completed the development of the Beaver River Watershed Coordinated Resource Management Plan (CRMP) and Watershed Restoration Action Strategy. The CRMP identifies potential water quality limitations and establishes implementation strategies focused on improving water quality. The CRMP also provides additional leverage for water quality improvement project funding.

An initial summary of water quality results indicate that although there was a decline in the average annual total phosphorus concentrations, the pollution indicator value of 0.05 mg/L is exceeded in all samples. Results from this initial evaluation imply project implementation is having a positive effect on water quality but substantial work is required to achieve desired water quality end points.
